Adobe Photoshop is arguably the best non-photorealistic editing software in the entire Creative Suite, and now you can edit a batch of images in just one click. This new batch control feature means you can automate the batch editing of a host of different objects, such as layer styles, colors, and so on. The latest update also brings a new way of editing your images, so you can preview changes in real time and make quick changes before saving them. The successor to Photoshop CS3 is wholly new and packs a number of great new features. Notably, the addition of the Content-Aware Move function allows you to effortlessly move objects around your picture. Change the object's size and perspective with a single command, so that you can easily create your very own photo montages. You can even remove an object from one place and replace it with another, giving you a much more natural way of turning one frame of a video into two. Since Photoshop CS5, it has become possible to stack, or insert, two pictures in a single document. Like most advanced features in Photoshop, this is actually a placeholder while the application undergoes some major improvements. In the future, we can look forward to a single file for a layered image, with an insert effect where the original source picture is shown in the background and the inserted image appears, with only the borders showing where the two pictures overlap. Now that's a picture well worthy of Photoshop! Other new features include new drawing tools, live filters, a new adjustment brush option, a new shape-building function, and the ability to key talent. The mesh-based equalizing and contrast features in Photoshop CS5 let you edit the tonal values across an image to optimise them to any specific area of your image, instead of having to manually fine-tune every individual bump and blemish. No longer will you have to battle with "saturated" or "desaturated: colors," and you can simply fine-tune the setting you want in any area of your image.

The future of Adobe's popular Photoshop is uncertain. The company could retire the traditional Photoshop product line or offer new services that incorporate additive changes to photographs. By rethinking how copyright and creative work might fit into the web of devices and services available, it has the chance to make photography easier than it ever has been. If everyone can use the tricks now used by professionals to make their pictures look amazing, we can bypass the trappings of the technology industry's copyright controversies, and move forward with digital products others can use. The universal nature of the photograph gives people more freedom to share and collaborate. That's what Adobe wants to preserve. It wants to see more of the things we love, like the fact that a single tool, as unique as the photographer's choices and vision, can transport us to another time, another place, another era. That's what Adobe wants to preserve. But Adobe thinks that the future will also demand new digital materials, from preserving ancient texts (and preventing their degradation) to scientifically inspired performance art. That will be the future of photography, but it will require us to learn new tools, figure out how to use them, and adapt to all these new risks and

rewards. Will we be willing to learn, or will we just want the imaging equivalent of a nice SUV, with each new generation of Royal cameras rolling off the manufacturing line without a new mode of operation, a new set of warranty requirements, or a new set of safety requirements?
